Laporan Akhir Praktikum Jaringan Komputer

Vlan Trunk OSPF MultiVendor

Arini Yanua Sari - 5024241015

2026

1 Langkah-Langkah Percobaan

1.1 Praktikum 1 Konfigurasi Cisco Switch

1. Pada step pertama ini, Cisco Switch akan dikonfigurasi untuk: Membuat VLAN 10, 20, 30, dan 40. Mengatur port menuju PC sebagai access port. Mengatur port menuju Cisco Router sebagai trunk port. Mengatur port menuju Huawei LAN sebagai access port untuk network 192.168.50.0/24.

(a) Masuk ke terminal Cisco Switch dan kemudian membuat Vlan

```
* purposes is expressly prohibited except as otherwise authorized by
* Cisco in writing.
*****
Switch>enable
Switch#config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#vlan 10
Switch(config-vlan)#name Finance
Switch(config-vlan)#exit
Switch(config)#vlan 20
Switch(config-vlan)#name HR
Switch(config-vlan)#exit
Switch(config)#vlan 30
Switch(config-vlan)#name IT
Switch(config-vlan)#exit
Switch(config)#vlan 40
Switch(config-vlan)#name Marketing
Switch(config-vlan)#exit
Switch(config)#
```

Gambar 1

(b) Pastikan vlan sudah dibuat dan statusnya aktif

```
Switch#wr
Building configuration...
Compressed configuration from 2905 bytes to 1378 bytes[OK]

1.3 Praktikum 3 Konfigurasi Huawei Router dan IP Address Antarrouter

(a) Tujuan Pada praktikum ini, praktikan akan belajar untuk konfigurasi: LAN pada sisi Huawei dengan network 192.168.50.0/24. IP address link Cisco Huawei, IP address link Huawei MikroTik, IP address link Cisco MikroTik, pengujian konektivitas antarrouter sebelum masuk ke OSPF.

i. Konfigurasi Lan Huawei

```

Enter system view, return user view with return command.
[~HUAWEI]
[~HUAWEI]interface Ethernet1/0/2
[~HUAWEI-Ethernet1/0/2] description LAN-HUAWEI
[*HUAWEI-Ethernet1/0/2] ip address 192.168.50.1 255.255.255.0
[*HUAWEI-Ethernet1/0/2] undo shutdown
[*HUAWEI-Ethernet1/0/2] quit
[*HUAWEI]
[*HUAWEI]commit
[~HUAWEI]

```

Gambar 26

ii. Konfigurasi IP VPC Lan Huawei, Pada pc lan huawei: ip 192.168.50.10/24 192.168.50.1 kemudian Verifikasi: show ip

```

VPCS> ip 192.168.50.10/24 192.168.50.1
Checking for duplicate address...
PC1 : 192.168.50.10 255.255.255.0 gateway 192.168.50.1

VPCS> show ip
NAME      : VPCS[1]
IP/MASK   : 192.168.50.10/24
GATEWAY   : 192.168.50.1
DNS       :
MAC       : 00:50:79:66:68:3e
LPORT     : 20000
RHOST:PORT : 127.0.0.1:30000
MTU       : 1500

```

Gambar 27

iii. Testing ping gateway huawei: ping 192.168.50.1

```

VPCS> ping 192.168.50.1
64 bytes from 192.168.50.1 icmp_seq=1 ttl=255 time=7.575 ms
64 bytes from 192.168.50.1 icmp_seq=2 ttl=255 time=2.284 ms
64 bytes from 192.168.50.1 icmp_seq=3 ttl=255 time=2.423 ms
^C

A. Dari Cisco Router

```
Router#ping 10.10.10.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.10.10.2, timeout is 2 seconds:
!!!!
Success rate is 80 percent (4/5), round-trip min/avg/max = 1/1/3 ms
Router#ping 10.10.11.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.10.11.2, timeout is 2 seconds:
!!!!
Success rate is 80 percent (4/5), round-trip min/avg/max = 1/1/3 ms
Router#ping 10.10.30.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.10.30.2, timeout is 2 seconds:
!!!!
Success rate is 80 percent (4/5), round-trip min/avg/max = 1/1/2 ms

1.4 Praktikum 4 Konfigurasi OSPF Multivendor dan OSPF Cost

(a) Tujuan Pada praktikum ini, praktikan mengkonfigurasi routing dinamis menggunakan OSPF pada tiga perangkat berbeda: Cisco Router, Huawei Router, Mikrotik Router

i. Konfigurasi ospf pada Cisco Router

A. Konfigurasi OSPF

```

Router(config)#router ospf 1
Router(config-router)#router-id 1.1.1.1
Router(config-router)#network 10.10.10.0 0.0.0.3 area 0
Router(config-router)#network 10.10.11.0 0.0.0.3 area 0
Router(config-router)#network 10.10.30.0 0.0.0.3 area 0
Router(config-router)#network 192.168.10.0 0.0.0.255 area 0
Router(config-router)#network 192.168.20.0 0.0.0.255 area 0
Router(config-router)#network 192.168.30.0 0.0.0.255 area 0
Router(config-router)#network 192.168.40.0 0.0.0.255 area 0
Router(config-router)#exit
Router(config)#

```

Gambar 41

B. Atur OSPF cost pada interface Cisco.

```

Router(config)#interface g10/3
Router(config-if)#description LINK1-TO-HUAWEI
Router(config-if)#ip ospf cost 10
Router(config-if)#exit
Router(config)#interface g10/0
Router(config-if)#description LINK2-TO-HUAWEI
Router(config-if)#ip ospf cost 10
Router(config-if)#exit
Router(config)#interface g10/1
Router(config-if)#description LINK-TO-MIKROTIK
Router(config-if)#ip ospf cost 100
Router(config-if)#exit

```

Gambar 42

C. Verifikasi OSPF Cisco: show ip ospf neighbor show ip route ospf, kemungkinan akan kosong jadi lakukan show ip protocols

```

Routing Protocol is "ospf 1"
  Outgoing update filter list for all interfaces is not set
  Incoming update filter list for all interfaces is not set
  Router ID 1.1.1.1
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  Maximum path: 4
  Routing for Networks:
    10.10.10.0 0.0.0.3 area 0
    10.10.11.0 0.0.0.3 area 0
    10.10.30.0 0.0.0.3 area 0
    192.168.10.0 0.0.0.255 area 0
    192.168.20.0 0.0.0.255 area 0
    192.168.30.0 0.0.0.255 area 0
    192.168.40.0 0.0.0.255 area 0
  Routing Information Sources:
    Gateway         Distance      Last Update
  Distance: (default is 110)

```

Gambar 43

ii. Konfigurasi OSPF pada Huawei Router

A. Konfigurasi OSPF pada Huawei Router

```

2 Analisis Hasil Percobaan

Pada Praktikum 1, kegiatan difokuskan pada penerapan segmentasi jaringan secara logis pada layer 2 menggunakan teknologi Virtual Local Area Network (VLAN) pada Cisco Switch. Dari hasil konfigurasi yang dilakukan, switch berhasil membentuk empat segmen jaringan yang terpisah, yaitu VLAN 10 (Finance), VLAN 20 (HR), VLAN 30 (IT), dan VLAN 40 (Marketing). Setiap port yang terhubung ke perangkat client dikonfigurasi sebagai access port sesuai VLAN masing-masing sehingga paket yang dikirimkan menuju end device tidak membawa tag VLAN (untagged). Sementara itu, interface Gi0/0 yang terhubung ke Cisco Router dikonfigurasi sebagai trunk port dengan standar IEEE 802.1Q (dot1Q). Hasil verifikasi menggunakan perintah *show vlan brief* dan *show interfaces trunk* menunjukkan bahwa seluruh VLAN telah aktif dan dapat melewati satu jalur fisik yang sama menuju router. Dengan konfigurasi tersebut, lalu lintas data antar-VLAN pada switch tetap terisolasi sehingga keamanan dan pemisahan jaringan dapat terjaga dengan baik.

Pada Praktikum 2, percobaan dilanjutkan dengan membangun komunikasi antar-VLAN menggunakan metode Router-on-a-Stick (ROAS) pada layer 3 serta menyediakan layanan pengalihan IP secara dinamis. Cisco Router berperan sebagai gateway dengan membagi interface fisik Gig0/2 menjadi beberapa subinterface logis, yaitu Gig0/2.10, Gig0/2.20, Gig0/2.30, dan Gig0/2.40. Setiap subinterface dikonfigurasi menggunakan *encapsulation dot1Q* sesuai VLAN yang dilayani dan diberikan alamat IP sebagai gateway jaringan. Selain menjalankan fungsi routing antar-VLAN, router juga dikonfigurasi sebagai DHCP Server untuk VLAN 10 dan VLAN 20 dengan memanfaatkan fitur *excluded-address* untuk membatasi rentang alamat yang dapat didistribusikan. Adapun VLAN 30 dan VLAN 40 menggunakan konfigurasi IP statis pada sisi client. Berdasarkan hasil pengecekan melalui *show ip interface brief* dan *show ip dhcp pool*, seluruh subinterface berada dalam kondisi aktif dan layanan DHCP berjalan dengan baik. Pengujian dari sisi VPCS menunjukkan bahwa client pada VLAN 10 dan VLAN 20 berhasil memperoleh alamat IP secara otomatis, seluruh perangkat dapat mengakses gateway masing-masing, serta komunikasi antar-VLAN berhasil dilakukan melalui proses routing yang dijalankan oleh router.

Pada Praktikum 3, dilakukan pembangunan koneksi point-to-point dalam lingkungan jaringan multivendor yang melibatkan perangkat Cisco, Huawei, dan MikroTik. Sebuah segmen LAN tambahan diaktifkan pada Huawei Router melalui interface Ethernet1/0/2 dengan jaringan 192.168.50.0/24, sementara client pada segmen tersebut menggunakan konfigurasi IP statis. Seluruh koneksi antar-router menggunakan subnet dengan prefix /30 agar penggunaan alamat IP lebih efisien, karena setiap jalur hanya memerlukan dua alamat yang dapat digunakan. Praktikum ini juga memperlihatkan perbedaan mekanisme konfigurasi pada masing-masing vendor, seperti penggunaan *system-view* dan *commit* pada Huawei, serta pendekatan berbasis direktori pada MikroTik. Hasil verifikasi menunjukkan seluruh interface penghubung berada pada status *up* dan pengujian ping antar-router berhasil dilakukan. Namun, konektivitas yang tersedia masih terbatas pada perangkat yang terhubung langsung karena belum terdapat mekanisme routing untuk menjangkau jaringan yang lebih jauh.

Pada Praktikum 4, seluruh jaringan yang telah dibangun sebelumnya diintegrasikan menggunakan protokol routing dinamis Open Shortest Path First (OSPF) dengan konfigurasi single area, yaitu Area 0 sebagai backbone. Masing-masing router mengiklankan jaringan yang terhubung langsung dengannya menggunakan wildcard mask pada Cisco dan Huawei, sedangkan MikroTik menggunakan network address secara langsung. Salah satu aspek penting dalam percobaan ini adalah pengaturan nilai cost OSPF, di mana link Cisco–Huawei sengaja diberikan cost 10 sebagai jalur utama, sedangkan jalur yang melewati MikroTik diberi cost 100 sehingga berfungsi sebagai jalur cadangan. Berdasarkan hasil verifikasi menggunakan *show ip ospf neighbor* dan *display ospf peer*, hubungan neighbor antar-router berhasil mencapai status FULL. Pertukaran Link State Advertisement (LSA) memungkinkan setiap router membangun tabel routing yang lengkap. Pada sisi Cisco, rute menuju jaringan Huawei (192.168.50.0/24) menampilkan dua next-hop yang berbeda, menandakan bahwa fitur Equal-Cost Multi-Path (ECMP) berjalan dengan baik untuk mendistribusikan trafik melalui dua jalur utama yang memiliki cost sama. Keberhasilan praktikum dibuktikan dengan pengujian konektivitas end-to-end, di mana seluruh PC pada VLAN Cisco dapat berkomunikasi dengan PC pada jaringan Huawei dan sebaliknya.

Pada Praktikum 5, seluruh konfigurasi yang telah diterapkan sebelumnya berhasil dijalankan sesuai dengan tujuan percobaan. Hasil pengujian menunjukkan bahwa fitur dan layanan yang

dikonfigurasi dapat beroperasi dengan baik serta menghasilkan konektivitas jaringan yang sesuai dengan skenario yang dirancang. Dengan demikian, percobaan kelima dapat dinyatakan berhasil dilaksanakan tanpa kendala yang menghambat proses komunikasi maupun fungsi jaringan yang diuji.

3 Hasil Tugas Modul

(a) Tugas modul dapat dilihat pada file readme yang ada pada github kelompok.

4 Kesimpulan

Secara keseluruhan, rangkaian praktikum yang dilaksanakan mulai dari Praktikum 1 hingga Praktikum 5 berhasil menunjukkan proses pembangunan dan integrasi jaringan multivendor yang melibatkan perangkat Cisco, Huawei, dan MikroTik. Implementasi dilakukan secara bertahap dari Layer 2 hingga Layer 3. Tahap awal difokuskan pada segmentasi jaringan menggunakan VLAN dan mekanisme trunking berbasis IEEE 802.1Q untuk memisahkan lalu lintas data antar segmen. Selanjutnya, komunikasi antar-VLAN diwujudkan melalui metode Router-on-a-Stick (ROAS), sementara pengelolaan alamat IP secara otomatis dilakukan dengan memanfaatkan layanan DHCP Server pada Cisco Router.

Pada tahap berikutnya, koneksi point-to-point antar-router dari vendor yang berbeda berhasil dibangun sehingga memungkinkan terbentuknya jalur komunikasi antarperangkat jaringan. Integrasi seluruh segmen kemudian disempurnakan melalui penerapan protokol routing dinamis OSPF pada Area 0 (Backbone). Melalui proses pertukaran informasi routing, setiap router mampu mengenali jaringan yang berada di luar koneksi langsungnya dan membangun tabel routing secara otomatis.

Pengaturan nilai cost pada OSPF turut memberikan hasil yang sesuai dengan perancangan jaringan, yaitu terbentuknya jalur utama dan jalur cadangan yang dapat digunakan untuk meningkatkan keandalan komunikasi. Selain itu, fitur Equal-Cost Multi-Path (ECMP) berhasil diimplementasikan pada jalur dengan cost yang sama sehingga memungkinkan distribusi trafik melalui lebih dari satu lintasan. Mekanisme ini berkontribusi dalam meningkatkan efisiensi penggunaan jaringan sekaligus mendukung proses load balancing.

Berdasarkan seluruh hasil pengujian yang dilakukan, dapat disimpulkan bahwa seluruh percobaan pada Praktikum 1 hingga Praktikum 5 berhasil dilaksanakan dengan baik. Setiap tahapan konfigurasi mampu berfungsi sesuai tujuan yang telah ditetapkan, mulai dari segmentasi jaringan, routing antar-VLAN, interkoneksi multivendor, hingga implementasi routing dinamis. Dengan konfigurasi yang tepat, perangkat dari vendor yang berbeda dapat saling berkomunikasi dan bekerja secara terintegrasi sehingga menghasilkan jaringan yang fungsional, efisien, dan andal.
